The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpCES-1). The Chuman mpGES-1 gene is located on chromosome 9, more specifically to CC 9q34.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hbridise with the nucleic acid mpGES-1 and CC inhibits its expression; (2) a method of inhibiting the expression of mCCS having a disease or condition and (3) a method of treating an animal CC having a disease or condition and antisense compounds have cytostatic, cantisense oligonuclectides and antisense compounds have cytostatic, cantidiabetic, immunomodulator, cardiant, neuroprotective, antisinflammatory, neuroprotective, nootropic, antisinflammatory, neuroprotective, nootropic, antisinflammatory, neuroprotective, nootropic, antisinflammatory, inhibitors and in gene therapy. The antisense compound can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        providing a target nucleic acid, e.g. hepatitis C virus nucleic acid having non-contiguous single-stranded regions (NCSR) separated by an intervening region, a bridging oligonucleotide capable of binding to the first and second NCSR; a second oligonucleotide binding to a portion of the first NCSR and a cleavage agent, and mixing the contents to form a cleavage structure. The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic purposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents a primer used in the isolation of Mycobacterium tuberculosis katG gene polynucleotide labelled with tetrachlorofluorescein (TET) used to demonstrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dong F,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonuclectide with
                                                                                                                                                                                                                                                                                                                                                                                                                         2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2004-203785/19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      14-AUG-2002; 2002US-0403416P

                                                                                                                                                                                                    The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 4; SEQ ID NO 7033; 417pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2004-203785/19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Roberds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-AUG-2002; 2002US-0403416P.

        The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate pain from burns, migraine headache, cluster headache, mild-to-moderate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517) where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            26-FEB-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nav1.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                   The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'MOZ wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       but not limited to neonatal or infantile epilepsy; or ataxia. The prisequence represents a chimeric phosphorothicate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4; SEQ ID NO 4748; 417pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition assocwith Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diabetic neuropathy; arthritic pain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nav1.3; Analgesic; Nootropic; Neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.

The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bhat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, high density lipoprotein or cardiovascular disorders.

The probe comprises a bar sequence that is complementary to the target nucleic acid and has at least one artificial mismatch and at least one original mismatch with respect to the target nucleic acid, where the artificial mismatch and original mismatch exist in different base positions. The probe of the invention may be useful for detecting genetic variation by gene amplification, mutation-specific DNA sequencing or a mutation-specific DNA chip, preferably for detecting a polymorphism in exon 2 of HLA-DRB1. The current sequence is that of a probe of the invention which was used to detect a polymorphism in human HLA-DRB1 exon 2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           respect

The antisense oligonucleotides are useful for modulating the expression of endothelial lipses in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20 BP; 8 A; 8 C; 1 G; 3 T; 0 U; 0 Other;

                                                                                                           The present invention relates to an oligonucleotide anti-sense to e.g., CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-cC end of nucleic acid target comprising gene(s) chosen from e.g. CC interleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the CC oligonucleotide. The method is useful for preventing or treating a CC respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is CC useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is CC chosen from airway inflammation, allergy(ies), asthma, impeded CC respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhintis (NR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway construction. The present sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                            The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human G protein-coupled receptor 6 (GPCR-6), which specifically hybridises with the nucleic acid encoding the GPCR-6 and inhibits expression of the GPCR-6. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the GPCR-6 and in preparation of a composition for treating a disease or condition associated with GPCR-6, e.g., a metabolic disorder, aberrant signal transduction in brain tissue, a neuronal, motor, sensory, psychiatric or behavioural disorder or drug or chemical addiction. This sequence represents an antisense
                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to nucleic acids encoding G protocoupled receptor 6 (GPCR-6), useful for treating animal having disconsisted with GPCR-6 e.g. metabolic, neuronal, motor, sensory or

                                The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (II)-4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (ODD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway that the first of the present a recent of the invertence of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADJ61654 standard; DNA; 20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                        The present invention relates to an oligonucleotide anti-sense to e.g., CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end and of nucleic acid target comprising gene(s) chosen from e.g. CC end of nucleic acid target comprising gene(s) chosen from e.g. CC coligonucleotide and optionally surfactant operatively linked to the CC oligonucleotide. The method is useful for preventing or treating a CC respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is compared to the prevention and/or treatment CC useful for production of a medicament for the prevention and/or treatment CC ensepiratory or lung disease. The respiratory or lung disease is CC chosen from airway inflammation, allergy(ies), asthma, impeded consen from airway inflammation, allergy(ies), asthma, impeded consention, cystic fibrosis (F), chronic obstructive pulmonary diseases CC (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                          This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; at 1 promoter site; at least one Tag gene comprising at least 5 20mer Tag sequences; a Poly A site having at least 21 consecutive A residues; a second restriction endonuclease site which may be the same or different than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.

CC (PTPA), that specifically hybridises with the nucleic acid molecule encoding phosphatuse activator (PTPA), that specifically hybridises with the nucleic acid molecule CC encoding phosphotyrosyl phosphatese activator and inhibits the expression of phosphotyrosyl phosphatese activator and inhibits the expression CC of phosphotyrosyl phosphatese activator in central the compound CC and a pharmaceutical carrier or diluent, a method of inhibiting the compound and a pharmaceutical carrier or diluent, a method of inhibiting the CC expression of phosphotyrosyl phosphatese activator in cells or tissues, a CC with phosphotyrosyl phosphatese activator and a method of screening for CC an antisense compound. The disease or condition associated CC with phosphotyrosyl phosphatese activator and a method of screening for CC antisense compound is useful in modulating the function of nucleic acid molecules encoding phosphotyrosyl phosphatese activator. The CCC antisense compound can also be used as trools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 2119
                                                                                                                                                                                                                                                                                                                                                                                New antisense compound targeted to a nucleic acid molecule encoding phosphotyrosyl phosphatase activator, for modulating expression of phosphotyrosyl phosphatase activator or treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                 Example

The compound specifically hybridises with the nucleic acid molecule encoding dual specific phosphatase 6 and inhibits the expression of dual specific phosphatase 6. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding dual specific phosphatase 6. The antisense oligonucleotide is useful for inhibiting the expression of dual specific phosphatase 6 in cells or tissues to treat diseases associated with their expression, suc as a hyperproliferative disorder, a condition arising from aberrant apoptosis, an inflammatory disorder or a developmental disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human dual specifi phosphatase 6 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Haem oxygenase 1; HO; hyperbilirubinaemia; neonatal jaundice; neurodegenerative disease; Alzheimer's disease; Parkinson's d antisense-therapy; nootropic; neuroprotective; human; phosphorothioate backbone; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
```

The present invention relates to antisense compounds, compositions and methods used for modulating the expression of haem oxygenase (HO) 1. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of haem oxygenase 1 such as sociated with aberrant expression or activity of haem oxygenase of sevention as the invention is also useful in antisense therapy. The present sequence is human haem oxygenase 1 target and fearable the present sequence is human haem oxygenase 1 target

New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of oxygenase 1, such as hyperbilirubinemia, neonatal jaundice and neurodegenerative diseases.

Example 15;

SEQ ID NO 54; 43pp; English

WPI; 2004-070587/07.

                   a nucleic acid molecule encoding dual specific phosphatase 6. The compound specifically hybridises with the nucleic acid molecule encoding dual specific phosphatase 6 and inhibits the expression of dual specific phosphatase 6. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule
                                                                                                                                                                                                                             New antisense oligonucleotides for modulating dual specific expression, useful for diagnosing, preventing or treating associated with the phosphatase, e.g. hyperproliferative
                                                                                                                              The invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC PIPRM. The invention may be useful for the production of compositions CC with a cytostatic or antidiabetic activity. In addition, the disclosed Sequences may be useful for gene therapy. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding PIPRM. The antisense compound can also be used as CC research tools and diagnostics. It can also be used as tools in CC differential and/or combinatorial analyses to elucidate expression CC patterns of a portion or the entire complement of genes expressed within CC conditions associated with PIPRM, preferably hyperproliferative disporder, CC compound can also be used as prophylaxis, for example diabetes. The CC compound can also be used as prophylaxis, for example to prevent or delay infection, inflammation or tumour formation. The present sequence is that CC was used during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Coenzyme A (HMG-COA) reductase, and inhibits the expression of HMG-COA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-COA reductase. This

New compounds, particularly antisense oligonucleotides targeted to nucleic acid encoding HMG-CoA reductase, useful for treating atherosclerosis, or a disease involving cholesterol metabolism or

The nove compounds have cardiant, antiarteriosclerotic, and antillpaemic activities. The compound can be used to treat disorders by antisense therapy. The compounds, compositions and methods are useful for treat a disease or condition associated with HMG-COA reductase, such as a disease or condition associated with HMG-COA reductase, such as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-COA reductase. This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC expression of a target polypeptide associated with lung airway or lung conversion of a cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, considered invention has antiallergic, antiinflammatory, and carrier and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung crease the amount of target polypeptide present in the lungs. The confilammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascomstriction. CC inflammation, allergies, asthma, impeded respiration, respiratory constructives syndrome, pain, cystic fibrosis, allergic richinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. CC thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into produce the anti-sense oligos corresponding to the oligonucleotides into produce the anti-sense oligon content of the system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel compound with an oligonucleotide 8-80 nucleotides in length targeted to a nucleic acid molecule encoding protein tyrosine phosphatase receptor type mu (PTPRM) which specifically hybridises with the nucleic acid molecule encoding PTPRM and inhibits the expression of PTPRM or specifically hybridises with at least 8-nucleotide portion of a preferred target region on a nucleic acid molecule encoding PTPRM. The invention may be useful for the production of compositions with a cytostatic or antidiabetic activity. In addition, the disclosed sequences may be useful for gene therapy. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding PTPRM. The antisense compound can also be used as research tools and diagnostics. It can also be used as tools in additional and/or combinatorial analyses to elucidate expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used for treating diseases or conditions associated with PTPRM, preferably hyperproliferative disorder, for example cancer or metabolic disorders, for example diabetes. The compound can also be used as prophylaxis, for example to prevent or delay infection, inflammation or tumour formation. The present sequence is that of an antisense oligonucleotide which may be used during the creation of
                                                                                                                                                       Cowsert

ABD24118/c
comprising oligonucleotides, effective for alleviating chronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or mallgnant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

reducing adenosine surfactant depletion bronchoconstriction, Claim 15;

SEQ ID NO 3429;

763pp; English.

invention

oligonucleotides,

cribes a novel composition (a) a first cleotides, effective for alleviating cleotides, effective for alleviating n, respiratory tract inflammation, all sensitivity, levels of adenosine (A) on or hyposecretion, when administered

first active

agent,

allergies and (A) or (A) receptors, ered to a mammal. The

describes

bronchodilating

agent.

The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis;

cc analgesic, hypotensive, immunosuppressive and cytostatic activity, is a control of the administered agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The confidence of the larget mRNA or to reduce the amount of target polypeptide present in the lungs. The confidence of the larget mRNA or to reduce the amount of target polypeptide present in the lungs. The confidence of the larget mRNA or to reduce the amount of target polypeptide present hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, respiratory confidence syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the bystem content of the serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system content of the system cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, in a parater of the composition of the invention has antiallergic, antiinflammatory, antiasthmatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nyce JW, L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

CC The invention also describes a kit, that comprises: (a) a delivery moved of device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a contrainer of the composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production of availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction are associated inflammation, allergies and/or surfaceant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, transplantation, allergies, asthma, impeded respiration, respiratory confict of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleoties into produces that free adenosine into the system of the oligonucleoties into produce that free adenosine into the system of the content of the system into the system of the surface and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2107
                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recepto surfactant depletion or hyposecretion, when administered to a mammal. oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and

                                                                                                                                            The invention comprises DNA sequences which are associated with intestinal epithelium and peyer's patch M cells. The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, anabylaxis, and blood group incompatibility. The present DNA sequence represents a PCR primer that was used to amplify an intestinal epithelium/peyer's patch M cell-associated DNA sequence of the invention.
                                                                                                                    Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated or purified polypeptide encoded by genes associated with intestinal epithelium or M cell development, differentiation or function, useful for treating autoimmune diseases and infectious diseases.
                                                                                                                                                                                                                                                                                                                                                        Disclosure;

The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents a PCR primer that was used to amplify an intestinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Grave's disease; multiple sclerosis; allergy; asthma; diabetic mellitus; immune system disorder; hypersensitivity; anaphylaxis; blood group incompatibility; ss; human; PCR; primer.

           The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cantiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cycostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or antiinflammatory static participation, increasing levels of ubiquinone or preventing and producing bronchodilation, increasing levels of ubiquinone or constitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                          The present invention relates to antisense oligonucleotides (ADA66459-ADA66609), which inhibit Transforming Growth Factor (TGF) beta-3 expression. The oligonucleotides are useful for inhibiting the expression of TGF-beta3 in cells or tissues, and for treating an animal having a disease condition associated with TGF-beta3, e.g. a hyperproliferative disorder such as cancers of lung, liver, colon, oesophagus, pancreas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; antirheumatic; antiarthritic; gynecological; antiarteriosclerotic; Transforming Growth Factor beta-3; hyperprolificrative disorder; cancers; atherosclerosis; rheumatoid arthritis; preeclampsia; fibrosis; phosphoroti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lung inflammation, lung allergies, or a respiratory disease or Note: The sequence data for this patent is not represented in t specification, but was obtained in electronic format directly f at ftp.wipo.int/pub/published pct sequences

                                                                                            The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or
            preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lung inflammation, 'lung allergies, or a respiratory disease or condition. Note: The sequence 'data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
```

CC first active agent comprising an oligonucleotide antisense to the circumstance of the codon, codon, coding region, 5' or 3' end genomic flanking regions, 5' or 10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antisinflammatory, antiallergic, antiasthmatic, hypotensive, 10 nas antisense gene therapy. The composition is useful for treating or 10 preventing a respiratory, lung or malignant disease or condition, also 11 for enhancing the prophylactic or therapeutic respiratory effect of an 11 antisense gene therapy to adenosine, reducing or depleting levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine or lung surfactant in a subject's tissue, or treating bronchoconstriction,

The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC greventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an contininflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 2098
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Loc

```

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation ocdon, coding region, or regions within 2-10 nucleotides of CI junctions of genes encoding a polypeptide associated with lung and/or consal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention can inflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of ubiquinone or contribution. New isolated NOVX polypeptides and preventing, diagnosing or treating

polynucleotides, useful for NOVX-associated disorders,

e.g.

designated as Q141K, V12M and Q126STOP. Identifying the gene polymorphism of BCRP of a test cell is useful for evaluating the expression grade of the side effect at the time of administering an anticancer agent to the test cell and evaluating the resistance of the test cell to the

The present invention relates to a method for evaluating the sensitivity of a cell to an anticancer agent. The method involves identifying a gene polymorphism in the human BCRP gene (the polymorphism is undefined in the specification). The gene polymorphisms encode variant BCRP polypeptides designated as 0.141K, V12M and 0.126STOP. Identifying the gene polymorphism designated as 0.141K, V12M and 0.126STOP.

the

Evaluating sensitivity of test cell to anticancer agent identifying gene polymorphism of BCRP.

                                                                                                              The present sequence is that of a reverse primer for polynucleotide NOV3b (gene CG92035-01 ADD93533), identified as C1q-related factor. The primer CC was used in a primer-probe set to examine expression of the CG92035-01 CC gene in different screening panels. The invention is based on the CG identification of proteins and polypeptides, and the nucleic acids CC exceeding them, that are differentially modulated in a pathological state, CC disease or an abnormal condition or state. These are target for CC therapeutic agents and can be used in screening methodologies to identify CC candidate therapeutic agents which interact with the target and thereby CC exert a desired or favourable effect, e.g. in neurogenesis, cell CC differentiation, cell proliferation, haematopoiesis, wound healing and CC disorders involving the novel human nucleic acids and proteins are CC provided. The nucleic acids are further used in gene therapy, as CC hybridization probes and primers, in chromosome mapping, tissue typing, or the proventive medicine, and pharmacogenomics.
                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        asthma, or infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                The present invention describes a method for predicting marbling in CC bovine comprising identifying a haplotype that is predictive of marbling, CC where the haplotype comprises a single nucleotide polymorphism (SNP) at CC nucleotide 244 and/or 575 of the bovine somatostatin (SST) gene. Also CC described is a method for predicting a trait in bovine comprising (CC identifying a haplotype that is predictive of the trait, where the CC haplotype comprises a SNP at nucleotide 244 and/or 575 of the bovine SST CC gene, and the trait is selected from yearling weight, actual fat CC thickness over 10th and 11th rib, quality grade, connective tissue, CC flavour and juiciness. The methods can be used for identifying a SNP that is predictive of marbling is used for CC predicting marbling in bovine. Identifying a haplotype comprising an SNP CC that is predictive of a trait, is used for identifying a trait in bovine, CC e.g. yearling weight, actual fat thickness over 10th and 11th rib, CC e.g. yearling weight, actual fat thickness over 10th and 11th rib, CC is used for selecting breeding bovines to produce offspring that exhibit increased marbling. The methods are useful for determining breeding CC increased marbling. The methods are useful for optimising the management conditive. The present sequence represents a PCR primer for bovine SCT which is used in an example from the present invention The bovine SCT.

                                                                                The invention relates to a substantially purified amino acid sequence comprising at least a portion of human calcium channel alpha2delta subunit splice isoform 1, splice isoform 2 sequence or splice isoform 3, or their variants, and their encoding nucleic acids (or their complements, variants, or homologues). Also included are screening a test compound for modulating calcium channel activity, an antibody which binds to the calcium channel or its variants and producing a transgenic non-their compound for modulating calcium channel activity, an antibody which binds to the calcium channel proteins are useful for generating an channel alpha 2delta subunit relative to a corresponding wild-type antibody (which is useful for detecting the proteins or their portions). The calcium channel proteins are useful for generating an antibody (which is useful for detecting the proteins or their portions). The transgenic animal (preferably a rodent e.g. mouse) is useful for identifying a therapeutic compound for treating a transgenic animal having cancer, sepecially lung cancer (small calc carcinoma or non-small cell carcinoma), breast cancer, nasopharyngeal cancer, cervical cancer, bad and neck cancer, a neurological disease, subtinifarct dementia, any careful cancer, carefu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New substantially pure human calcium channel alpha2delta subunit splice isoform 1, 2 and 3 sequence useful in preventing, treating and diagnosing cancer, neurological disorders and cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   brain trauma; Alzheimer's disease; multiinfarct dementia; seizure; amyotrophic lateral sclerosis; convulsions; Huntington's disease; amnesia; cardiovascular disease; cardiac arrhythmia; angina pectoris; hypoxic damage; ischaemia; myocardial infarction; SSCP; congestive heart failure; Lambert-Eaton myasthenic syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     congestive heart failure; or Lambert-Eaton myasthenic syndrome. The proteins and nucleic acids are useful in the diagnosis, prevention a treatment of the above mentioned diseases. The human gene for the ca channel is located on chromosome 3p21.3. The present sequence is an (single strand conformation polymorphism) and reverse transcriptase PCR primer used to detect and amplify polymorphic regions of the cal
                      The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha inhibitory oligonucleotide
                                                                                                                                                                                                                                         New antisense compounds, useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha, and for treating a disease or condition associated with expression of PKA regulatory subunit RII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ACD44777 standard; DNA; 20

Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an

The present invention describes a compound (I) that is 8-50 nucleobases CC in length: (a) targets a nucleic acid molecule encoding major histocompatibility complex (MHC) class II transactivator, and histocompatibility complex (MHC) class II transactivator, and inhibite the expression of MHC class II cransactivator; or (b) specifically hybridises with at least an 8-CC transactivator; or (b) specifically hybridises with at least an 8-CC nucleobase portion of an active site on a nucleic acid molecule encoding MHC class II transactivator. (I) has immunosuppressive, antimicrobial, CC antidiabetic, antirheumatic, antiarthritic, cytostatic, nootropic, CC neuroprotective and immunostimulant activities, and can be used as an MHC Class II transactivator antisense oligonucleotides can be used for transactivator inhibitor. The MHC class II transactivator, e.g. autoimmune disorder or infection. The antisense oligonucleotides can be used for inhibiting the expression of MHC class II transactivator; e.g. autoimmune disorder or infection. The antisense oligonucleotides can be called for inhibiting the expression of MHC class II transactivator; e.g. autoimmune disorder or infection. The antisense oligonucleotides can be called for inhibiting the expression of MHC class II transactivator; e.g. autoimmune disorder or infection. The antisense oligonucleotides can be called for inhibiting the expression of MHC class II transactivator in cells or tissues. In particular, these diseases include transplant and continue sclerosis, or severe combined immunodeficiency disease. The
                                                                           antisense compounds are useful for diagnostics, prophylaxis, research reagents or kits. The present sequence represents a class II transactivator chimeric phosphorothioate antisense

                                                                                                                                                                                                                                           RESULT 2088
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and/or modified nucleic acid (NA/MNA) reference material bound to a solid phase. (M) comprises digesting NA/MNA reference material using biochemical and/or chemical approaches, to obtain sequence fragments surrounding a specific recognition site, and selecting the NA/MNA sequence fragments associated with a specific recognition site. Also described: (1) fragments (I) obtained by (M); (2) nucleic acid and/or modified nucleic acid microarray (II) containing (I); (3) representation (III) of the genome or a part of the genome of an organism, comprising multiple copies of (I), or its selection, obtained by (M); and (4) NotI cloning of deleted sequences (CODE) genomic subtraction method based on the use of (I). (M) is useful for preparing nucleic acid and/or modified nucleic acid reference material bound to a solid phase. (III) is useful for discriminating between different genomes, detecting methylations, deletions, mutations and other changes within genomic material, obtained from the same individual at different points of time, or in the genomic material obtained from one individual as compared to a standard representation. The present sequence represents a PCR primer which is used
                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                  The invention relates to converting a liver stem/progenitor cell to a pancreatic functional cell that produces and secretes insulin in response to glucose stimulation. The method involves transfecting the liver stem/progenitor cell with a pancreatic development gene and/or culturing the liver stem/progenitor cell in a medium comprising factors that induce differentiation into the pancreatic functional cell, where the transfected cell is converted to the pancreatic functional cell. The method is useful in converted to the pancreatic functional cells to pancreatic functional cells that may be used for treating diabetes. Sequences ACC47827-862 represent PCR primers used in a Southern blotting experiment for characterisation of expression of various genes in liver stem/progenitor cells. The genes studied were pdx1, Hixb9, Isl1, ngn3, Nlkx2, Pax6, NeuroD/beta2, Nkx6.1, Pax4, insulin I, insulin II, glucagon, somatostatin. Pn. amvlase. elastase. Glutt-2. clucokinsae. PC1. PC2. PC3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Converting liver stem/progenitor cells to a pancreatic functional cell, useful for treating diabetes, comprises transfecting liver cells with pancreatic development gene and/or culturing with pancreatic differentiation factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CPE; PCR; primer;

A compound of the invention has cytostatic, cardiant, virucide, osteopathic, and antiparasitic activity, and may act as a calreticulin-inhibitor, and have a use in antisense gene therapy. The antisense compound is useful for treating a disease or condition associated with calreticulin e.g. melanoma, viral warts, rubella, schistosomiasis, congenital heart block or osteoporosis. Further, it is useful as prophylaxis, research reagent and diagnostic. The present sequence is used in the exemplification of the invention. The sequence is a phosphorothioate oligonucleotide, having 2'-MOE wings and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compound that specifically expression of human calreticulin, useful osteoporosis or schistosomiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             virucide; osteopathic; antiparasitic; antisense gene therapy; melanoma;
viral warts; rubella; schistosomiasis; congenital heart block;
osteoporosis.
